

CREATOR & CREATED

BIOIA / WUOM

THE EVIDENT

Artificial intelligence, human intelligence and responsibility

We are concerned that artificial intelligence may reduce human capability.

We are concerned that it may think for us.

That it may write for us.

That it may decide for us.

That it may end up replacing capabilities that until now we considered our own.

The concern is legitimate.

But it leaves out an earlier question.

What happens to human responsibility?

Because human intelligence can fully understand a consequence and still continue producing it.

It can know that temperatures are rising and continue increasing pressure.

It can know that a territory is being degraded and continue extracting.

It can have more information, more calculation, more connectivity and more technological capability than any previous generation and, nevertheless, fail to assume proportionally greater responsibility.

The problem, then, does not begin with artificial intelligence.

AI simply makes it more visible.

THE EVIDENT

CAPABILITY ≠ RESPONSIBILITY

Intelligence makes understanding possible.

Capability makes intervention possible.

Responsibility requires taking responsibility for the consequences.

They are not equivalent.

A society can enormously increase its technical capability without increasing its responsibility.

And artificial intelligence can multiply that capability even further without resolving that difference.

That is why the problem is not only to ask:

How far will artificial intelligence go?

We should also ask:

How far is the human willing to answer for what it is already capable of doing?

DELEGATION HAS A LIMIT

We can delegate calculation.

We can delegate search.

We can delegate classification.

We can delegate the production of text, images, code or diagnosis.

We can even delegate parts of a decision.

But there is something that does not disappear through delegation:

responsibility for using the result.

The machine can produce an answer.

The human remains the one who brings it into the world.

AI can amplify an action.

The human remains part of the chain that turns it into a consequence.

Delegating capability does not mean delegating responsibility.

THE ERROR OF ORIENTATION

The debate usually places the machine in front:

 **What will AI do?**

And the human behind:

 **What will happen to us?**

BIOIA / WUOM reverses the observation:

 **What is the human doing?**

 **What capability is AI amplifying?**

 **Where do the consequences materially end up?**

The last question returns the problem to the territory.

Because a decision can be produced within a global network, executed through artificial intelligence and distributed across thousands of systems.

But its consequences are not abstract.

They consume energy.

They use water.

They transform soil.

They mobilize materials.

They affect organisms.

They alter living conditions.

The network can distribute the action.

It cannot dematerialize its consequences.

THE EVIDENT

Perhaps the main risk is not that artificial intelligence thinks too much.

Perhaps it is that the human uses more and more intelligence —both human and artificial— without proportionally increasing responsibility.

We have learned to amplify capability.

We have not yet learned to amplify responsibility at the same pace.

And while we discuss the future limits of artificial intelligence, we continue avoiding a much older question:

the limits humans should impose on themselves when they know the consequences of their actions.

BIOIA / WUOM

Intelligence can be partially delegated.

Responsibility cannot.

Because at the end of any technical architecture, a material relationship remains:

capability → decision → consequence → territory

And as long as there is a consequence, there is a return still pending.

Without return, there is extraction.

BIOIA / WUOM, 2026

THE EVIDENT

Intelligence can be partially delegated.

Responsibility cannot.

Every capacity leaves a footprint.
Every decision **demand**s a **return**.

WITHOUT RETURN, THERE IS EXTRACTION.

The future is not delegated. It is built.

The territory remembers.

THE EVIDENT • Intelligence can be partially delegated • Responsibility cannot.
