

# THE DOUBLE DIRECTION

PRESSURE AND CAPACITY

## WILDFIRE

EXTREME RISK

## ECLIPSE

EXTRAORDINARY EVENT

THE SAME CAPACITY CAN OPERATE IN OPPOSITE DIRECTIONS.

BIOIA / WUOM

THE DOUBLE DIRECTION, PRESSURE AND CAPACITY.

## TWO FLOWS

### TWO DIRECTIONS OVER THE SAME MATERIAL BASE

During an emergency, governance may need to reduce human pressure on the territory:

🔥 🚶 🚧 **risk** → **evacuation** → **restriction** → **less exposure**

At the same time, in response to a planned extraordinary event, that same architecture may organize additional pressure:

🌐 😎 🚗 🚒 **event** → **visitors** → **mobility** → **deployment**

Both operations may be technically correct when considered separately.

The problem appears when they are observed together.

One part of the system is trying to move people out of compromised territories while another part organizes new inflows into a territorial context that remains exposed to heat, wildfire risk, drought and finite operational capacity.

### THIS IS NOT A CONTRADICTION BETWEEN PEOPLE

This does not mean that the same police officers, firefighters, municipalities or resources are necessarily involved.

Nor does it mean that the eclipse causes the wildfires.

The issue lies at another scale:

**two governance decisions can operate in opposite directions over the same underlying material condition.**

## BIOIA HYPOTHESIS

Capacity cannot be assessed only by asking:

**how many resources can we deploy?**

We must also ask:

**what direction is that deployment sustaining?**

**CAPACITY ≠ DIRECTIONAL COHERENCE**

## A SHARED TERRITORIAL BASE

### THE CONTEXT DOES NOT RESET BETWEEN ONE DECISION AND ANOTHER

Evacuating people because of a wildfire and organizing visitors for an eclipse may take place in different locations.

But both decisions rely on the same material base:

-  **territory**
-  **heat**
-  **available water**
-  **wildfire risk**
-  **access routes**
-  **operational capacity**
-  **response time**

Governance may separate each event administratively.

**The territory does not.**

### CAPACITY IS FINITE

A road can only absorb a certain volume of traffic.

A car park has a limited capacity.

An emergency operation has limited resources.

An evacuation requires time, access routes and clear roads.

And a territory exposed to heat, dryness or wildfire does not recover capacity simply because another event begins.

That is why adding organization does not automatically mean adding territorial capacity.

**Institutional capacity may increase.**

**Material capacity may continue to decrease.**

## THE SAME GROUND RECEIVES BOTH FLOWS

🔥 → less human presence  
because exposure to risk increases.

🌿 → more human presence  
because an extraordinary influx is being organized.

The BIOIA question appears exactly between these two movements:

**how much additional pressure can a territorial base absorb when it is already using part of its capacity to respond to another pressure?**

This is not about claiming that the entire territory is saturated.

It is about recognizing that available capacity depends on prior material conditions, not only on the operational deployment that comes afterward.

## BIOIA HYPOTHESIS

**The same infrastructure can manage two flows.**

**That does not mean the territory can absorb them indefinitely.**

# IT'S NOT JUST CAPACITY IT'S DIRECTION

IT'S NOT JUST CAPACITY IT'S DIRECTION.

## CAPACITY ≠ COHERENCE

### MORE DEPLOYMENT DOES NOT NECESSARILY RESOLVE DIRECTION

Under extraordinary pressure, the institutional response is often expressed in terms of capacity:

- +  **security**
- +  **emergency services**
- +  **assistance**
- +  **controls**
- +  **access management**

That increase may be necessary.

But by itself, it does not answer another question:

**what direction is that capacity being used to sustain?**

Because the same architecture can operate simultaneously to:

← **reduce exposure**

and to:

**increase influx** →

### TWO FUNCTIONS, ONE ARCHITECTURE

In an emergency:

  → **evacuate · restrict · protect**

At a planned event:

  → **organize · facilitate · assist**

The functions are not equivalent.

But they share resources, infrastructure, and the same underlying territorial condition.

Therefore:

**greater operational capacity does not guarantee greater territorial coherence.**

## THE QUESTION CHANGES

It is no longer enough to ask:

**can the system manage both situations?**

We must also ask:

**should it sustain both directions simultaneously when the territorial base is already under pressure?**

This is where the core of the double direction appears:

**CAPACITY  $\neq$  COHERENCE**

Governance may be technically capable of managing two opposing flows.

The question is whether both flows are territorially compatible.

## BIOIA HYPOTHESIS

**An architecture can be well coordinated and still sustain a territorially incoherent direction.**

## THE LIMIT

### WHEN CAPACITY STOPS MEANING MORE DEPLOYMENT

As long as sufficient margin exists, additional pressure can be managed through:

- + organization
- + personnel
- + control
- + information
- + coordination

But that mechanism is not infinite.

A point is reached when capacity stops being expressed as **more resources** and begins to be expressed as **less inflow**.

### THE LIMIT IS ALSO A RESPONSE

Other operations then appear:

- 🚧 restrict access
- 🚗 limit traffic
- 👤 reduce capacity
- ✖ cancel activities
- ↩ redirect flows

These are not necessarily management failures.

They may be precisely the sign that the architecture has recognized a material condition:

**the territory can no longer absorb additional pressure indefinitely.**

## **FROM CAPACITY TO DECISION**

The chain changes:

**RISK → CAPACITY → LIMIT → DECISION**

And this is where the double direction becomes visible.

One part of governance continues organizing inflow.

Another begins to reduce it.

The question is no longer only:

**can we manage it?**

But:

**at what point does managing stop meaning absorbing and start meaning limiting?**

## **BIOIA HYPOTHESIS**

**The limit does not appear when capacity disappears.**

**It appears when capacity recognizes that it is finite.**

Therefore:

**restricting can also be a form of return to the territory.**

# TWO FLOWS, ONE SHARED TERRITORY

## WILDFIRE

evacuations · closures · emergency

### 1. WILDFIRE

Active fire and spread

### 2. EVACUATIONS

Population in movement away from safe areas

### 3. EMERGENCY RESPONSE

Deployed resources and priority care

### 4. TERRITORIAL LIMITS

Closures and restrictions for protection

## ECLIPSE

visitors · access · deployment

### 1. ECLIPSE

Extraordinary astronomical event

### 2. VISITORS

Organized influx to observation points

### 3. ACCESS CONTROL

Traffic management and parking

### 4. SECURITY DEPLOYMENT

Public order and assistance for visitors

## THE MATERIAL BASE IS THE SAME.

heat · drought · risk · finite capacity
