

WHAT SHOULD ESTABLISH THE CONDITIONS OF THE FUTURE?

If the planet sustains life,
why do we organize our priorities
as if it were the last link in the chain?

CURRENT ORDER

Digital infrastructure sets the pace. Artificial intelligence optimizes processes. People adapt their behavior. Finally, the territory absorbs the material consequences. This model has enabled extraordinary advances, but it also shows increasing limits as environmental and territorial conditions deteriorate.

BIOIA PROPOSAL

In this architecture:

- The territory establishes the material conditions;
- People deliberate and decide;
- Artificial intelligence helps to read, relate and understand complex information;
- The network coordinates and distributes knowledge.

The question is not the technology.
The question is the order of priorities.

We are not rejecting technology.
We are organizing our priorities according to what **sustains life**.

THE ORDER OF PRIORITIES • What should establish the conditions of the future?

THE ORDER OF PRIORITIES

What should establish the conditions of the future?

A question of priorities

We are living through a period of extraordinary technological development. Artificial intelligence, digital networks, and computing capacity are advancing at an unprecedented pace. At the same time, the planet is experiencing increasing climatic, environmental, and territorial pressures.

This coincidence raises a simple yet fundamental question:

What should establish the conditions of the future?

The current order

Across many of our collective decisions, an implicit order seems to prevail:

Network → Artificial Intelligence → People → Territory

Digital infrastructure sets the pace. Artificial intelligence optimizes processes. People adapt their behavior. Finally, the territory absorbs the material consequences.

This model has enabled extraordinary progress, but it also reveals increasingly visible limits as environmental and territorial conditions deteriorate.

The basic order

BIOIA proposes reversing the starting point rather than rejecting technology.

The order would be:

Territory → Human Deliberation → Artificial Intelligence → Network

Within this architecture:

- the territory establishes the material conditions;
- people deliberate and make decisions;
- artificial intelligence helps read, relate, and understand complex information;
- the network coordinates and distributes knowledge.

The issue is not technology. The issue is the **order of priorities**.

The planet as a shared foundation

All human activity depends on a shared material foundation.

The economy, technology, energy systems, communications, and artificial intelligence all exist because a territory capable of sustaining them already exists.

When this order is inverted, the risk is that we continuously adapt the planet to the needs of our infrastructures instead of adapting our infrastructures to the conditions that sustain life.

A question of responsibility

This proposal does not call for halting technological development.

It raises a question of collective responsibility:

Can a society organize its priorities without placing first the material conditions that make its own existence possible?

Answering this question will be one of the most important decisions of the coming decades.

It is not a matter of choosing between nature and technology.

It is a matter of deciding **where order begins**.

Because the planet is not the last element in the chain.

It is the first.

BIOIA does not propose replacing one model with another through a slogan. It proposes recovering a priority order that can be discussed, examined, and improved publicly. If the planet constitutes humanity's shared material foundation, recognizing that condition ceases to be merely a philosophical option and becomes a matter of shared responsibility.
