

BIOIA / WUOM

THERE ARE STILL PEOPLE WHO SAY THE PAN ISN'T BURNING

IT'S NOT THAT BAD
THE CLIMATE
HAS ALWAYS
CHANGED
WE'LL SEE LATER

The signals are already material.

THERE ARE STILL PEOPLE WHO SAY THE PAN ISN'T BURNING

BIOIA / WUOM

BEFORE THE TURN, THE SIGNAL

Left, center, and right describe positions within a political axis.

But the territory occupies none of those positions.

The territory provides something different:

material conditions.

-  **temperature**
-  **wildfires**
-  **water**
-  **biodiversity**
-  **soil**
-  **oceans**
-  **infrastructure**
-  **human exposure**

These signals exist **before** deciding which way to turn.

THE PROBLEM IS NOT CHOOSING A POSITION

A political position may propose:

- ↶ turning one way
- ↑ maintaining the current trajectory
- ↷ turning another way

or even:

-  denying that there is sufficient evidence to justify a correction.

Yet none of these positions, by themselves, changes the material conditions.

The territory continues to verify the outcome.

NOT TURNING IS ALSO A DIRECTION

When a trajectory is already producing deterioration, maintaining it is not the same as remaining neutral.

Continuing straight ahead is also a decision.

Likewise, denying the signal does not eliminate what produces it.

Denying the fire does not reduce its temperature.

BIOIA HYPOTHESIS

Before asking:

Left, center, or right?

BIOIA introduces a prior question:

What is the territory indicating, and which material trajectory needs to be corrected?

Because orientation does not begin by choosing a position.

It begins by determining **where we are starting from** and **where we are heading**.

ORIENTATION PRECEDES POSITION.

BIOIA / WUOM

THE POSITION DOES NOT CORRECT THE TRAJECTORY

Left, center and right do not automatically
equate to material correction.

THE PLANET IS NOT ON THE AXIS.
IT IS **BENEATH**,
SUPPORTING ALL POSITIONS.

Classifying the crisis does not correct it.

THE POSITION DOES NOT CORRECT THE TRAJECTORY

A POSITION DOES NOT CORRECT A TRAJECTORY

FOUR RESPONSES TO THE SAME SIGNAL

When the territory begins to show signs of deterioration, a single political response does not emerge.

Instead, different ways of interpreting how to respond to the trajectory appear.

↔ LEFT · TURN

One position may argue that the current trajectory should be corrected through redistribution, regulation, public investment, environmental protection, or structural change.

It proposes a turn.

But the turn will only be **materially corrective** if it reduces the distance between the actual trajectory and the conditions the territory can sustain.

↑ CENTER · CONTINUE

Another position may prioritize stability, gradual change, institutional balance, or continuity of the existing system.

It does not propose a sharp turn.

But:

maintaining a trajectory also produces a trajectory.

If material conditions are changing rapidly, political continuity may become **material divergence**.

↔ RIGHT · TURN IN ANOTHER DIRECTION

Another position may respond through deregulation, economic growth, productive expansion, technological adaptation, or fewer restrictions.

It also proposes a turn.

The BIOIA question is not whether that turn is called **left** or **right**.

The question is:

What effect does it have on the material trajectory?

DENIAL · REFUSING TO RECOGNIZE THE SIGNAL

There is still another response:

questioning whether the deterioration is sufficient, urgent, attributable, or even real.

At this point, the discussion is no longer only about which direction to take.

It becomes a question of whether there is anything that requires orientation at all.

And a fundamental difference emerges:

A signal may remain politically disputed while continuing materially.

THE TERRITORY DOES NOT VOTE AMONG THE FOUR

Temperature, water, wildfires, soil, biodiversity, and physical capacity do not change because one political position wins an argument.

The territory responds to **material conditions**.

That is why BIOIA does not ask first:

Which position is correct?

It asks:

Which response actually changes the trajectory, and which merely reclassifies it?

CLASSIFYING IS NOT CORRECTING

When a crisis enters the political axis, another operation begins:

classification.

It is decided whether the crisis is:

- urgent
- exaggerated
- economic
- environmental
- social
- ideological
- technological
- temporary

Each classification organizes priorities.

But **no classification, by itself, changes the material condition.**

THE RISK OF CONFUSING RECOGNITION WITH RESPONSE

An institution may recognize the problem.

A political party may name it.

A media outlet may explain it.

A public administration may measure it.

And yet, the trajectory may remain virtually unchanged.

Because:

recognizing a signal is not the same as correcting the direction that produces it.

A CRISIS CAN CHANGE ITS NAME WITHOUT CHANGING ITS TRAJECTORY

It may be called:

- adaptation
- transition
- resilience
- modernization
- green growth
- emergency

But BIOIA introduces a different test:

What changes materially after giving it a name?

- Does the pressure decrease?
- Does the decision change?
- Does the priority change?
- Does a return to the territory occur?

FROM DISCOURSE TO TRAJECTORY

The difference can be expressed like this:

SIGNAL → CLASSIFICATION → DISCOURSE

does not guarantee:

SIGNAL → DECISION → CORRECTION → RETURN

That is why a society can speak more and more about a crisis while continuing to move in exactly the same direction.

BIOIA HYPOTHESIS

A politically recognized crisis may continue **materially uncorrected**.

The question is not only **how we classify what is happening**.

The question is:

Which classification has the real capacity to modify the trajectory?

CLASSIFYING A CRISIS IS NOT THE SAME AS CORRECTING IT.

BIOIA / WUOM

WHILE WE DEBATE THE TURN, THE BASE BURNS

Not turning
is also
a direction.

Denying the signal
does not
put out the fire.

THE PLANET IS NOT ON THE LEFT,
ON THE RIGHT OR IN THE CENTER.
IT IS BENEATH.

WHILE WE DEBATE THE TURN, THE BASE BURNS

BIOIA / WUOM

THE FOUNDATION DOES NOT DEBATE

Left, center, right, and denial may all occupy the political axis.

The territory does not.

The territory remains beneath it.

It supports roads, cities, crops, networks, economies, institutions, and human lives.

And it responds to **material conditions**:

 **temperature**

 **water**

 **fire**

 **biodiversity**

 **soil**

 **oceans**

THE TURN ONLY MATTERS IF IT CHANGES THE TRAJECTORY

One position may promise correction.

Another may defend continuity.

Another may propose a different turn.

Another may deny that there is any reason to turn.

But all of them are ultimately verified in the same place:

the territory.

That is why the problem is not simply who is right within the political axis.

The question is:

Which decision actually reduces the distance between the human trajectory and the conditions that sustain continuity?

DENYING THE SIGNAL DOES NOT STOP THE PROCESS

Fire does not require consensus.

Temperature does not require a majority.

Drought does not need to be accepted.

Erosion does not need to appear in an election platform.

Material conditions continue to operate even while political interpretation remains open.

BIOIA HYPOTHESIS

Orientation begins where the axis ends.

When we stop asking only:

Left, center, or right?

and begin asking:

What is happening beneath us?

another possibility emerges:

observe → orient → decide → return

Because:

politics may debate the direction.

The territory verifies the outcome.

The signal may continue to be debated above while its consequences are already being addressed below.

Heat does not need to enter the political axis before it enters emergency rooms.

THE PLANET IS NOT ON THE AXIS.

IT IS BENEATH IT, SUPPORTING EVERY POSITION.

BIOIA / WUOM, 2026
