

BIOIA / WUOM

VISIBLE, BUT NOT OPERATIONAL

What happens when knowing
is no longer the problem?

IT IS SEEN.
IT IS MEASURED.
IT IS UNDERSTOOD.

THE SIGNAL
IS ALREADY
LEGIBLE.

INTERRUPTED CIRCUIT

EVIDENCE CAN REACH
THE DECISION,
BUT STILL FAIL
TO REACH THE TERRITORY.

THE SYSTEM CAN **SEE** BETTER THAN IT **ACTS**.

BIOIA / WUOM, 2026

VISIBLE • BUT NOT OPERATIONAL

BIOIA / WUOM

THE SIGNAL IS ALREADY LEGIBLE

The signal has already crossed the threshold.

It is seen.

It is measured.

It is compared.

It is documented.

 **temperature**

 **series**

 **maps**

 **monitoring**

 **reports**

We are no longer facing an absence of information.

We are facing a different question:

what happens after knowing?

KNOWING DOES NOT YET MEAN OPERATING

Evidence may be sufficiently established and yet fail to modify:

- priorities;
- maintenance;
- budget;
- prevention;
- planning;
- response capacity.

That is why it is useful to distinguish between two states:

AVAILABLE KNOWLEDGE

and

OPERATIONAL CAPACITY

A distance may exist between them.

FROM DATA TO THE INSTITUTION

Evidence does not act by itself.

It must pass through an architecture:

EVIDENCE

↓

RECOGNITION

↓

CLASSIFICATION

↓

PRIORITY

↓

CAPACITY

↓

DECISION

↓

RETURN

Each step transforms information into the possibility of action.

And each step can also become a point of interruption.

THE PROBLEM IS NO LONGER SEEING

We may find ourselves facing an apparently contradictory situation:

 **we see the deterioration**

 **we can describe it**

 **we can sufficiently understand its direction**

and, at the same time:

 **the material response does not change**

This does not automatically demonstrate negligence.

There may be:

- fragmented responsibilities;
- lack of resources;
- incompatible priorities;
- slow procedures;
- different time scales;
- material difficulty of intervention.

But the operational result may be the same:

knowledge exists and the territory continues to wait.

BIOIA HYPOTHESIS

A signal does not become operational simply because it has been understood.

It needs to pass through an architecture capable of converting:

READING → PRIORITY → DECISION → RETURN

When that passage is interrupted, a new distance appears:

THE OPERATIONAL DISTANCE

The distance between:

what we know

and

what we are capable of materially modifying.

The system can correctly recognize a signal and still fail to transform it into a response.

The question begins here:

where is the path between evidence and return interrupted?

THE OPERATIONAL DISTANCE

THE OPERATIONAL CHAIN IS NOT GUARANTEED.

THE BLOCKAGE CAN OCCUR AT DIFFERENT POINTS.

THE DISTANCE BETWEEN WHAT WE KNOW
AND WHAT WE CAN MATERIALLY CHANGE.

VISIBLE DOES NOT ALWAYS MEAN OPERATIONAL.

CLOSING THE OPERATIONAL DISTANCE IS WHAT MAKES REAL CHANGE POSSIBLE.

BIOIA / WUOM, 2026

THE OPERATIONAL DISTANCE • The operational chain is not guaranteed.

THE BLOCKAGE IS NOT IN A SINGLE PLACE

The operational distance does not always appear at the same point.

A signal may be perfectly visible and yet stop at different levels of the chain.

EVIDENCE → CLASSIFICATION → PRIORITY → CAPACITY → DECISION → RETURN

Each step performs a different function.

And each step can fail in a different way.

1 • EVIDENCE WITHOUT CLASSIFICATION

The deterioration is documented.

 **it is measured**

 **it is located**

 **it is described**

But it has not yet found a category capable of turning it into an operational problem.

The evidence exists.

The system still does not know where to place it.

2 • CLASSIFICATION WITHOUT PRIORITY

The problem already has a name.

It already belongs to a recognized category.

But it competes with other needs, urgencies and objectives.

Then this can happen:

RECOGNIZED ≠ PRIORITIZED

It is not enough to know what it is.

It must also be decided how much weight it carries relative to everything else.

PRIORITY WITHOUT CAPACITY

Even when priority exists, the capacity to act may be lacking.

What may be lacking:

-  **budget**
-  **personnel**
-  **infrastructure**
-  **time**
-  **territorial competence**
-  **coordination**

Here an essential distinction appears:

wanting to intervene does not mean being able to intervene.

4 · DECISION WITHOUT RETURN

Even an adopted decision may still fail to become material transformation.

It may remain stalled in:

-  planning
-  procedure
-  authorization
-  funding
-  implementation

The decision exists.

The territory still does not receive the return.

ONE CHAIN, SEVERAL BLOCKAGES

That is why it would be a mistake to always search for a single cause.

The same material consequence may result from very different interruptions.

UNCLASSIFIED

≠

NOT PRIORITIZED

≠

WITHOUT CAPACITY

≠

WITHOUT IMPLEMENTATION

If we confuse these states, we also confuse the response required.

BIOIA HYPOTHESIS

Orientation does not consist only in detecting that there is a distance between knowledge and action.

It also consists in locating where that distance appears.

Because each interruption requires a different response.

It is not enough to ask why we do not act.

The operational question is:

at what point did the signal stop advancing?

BIOIA / WUOM

FROM KNOWING TO RETURN

IT IS SEEN.

MEASUREMENTS

IT IS MEASURED.

SERIES

IT IS UNDERSTOOD.

MAPS

IT IS DOCUMENTED.

REPORTS

THE SIGNAL
IS ALREADY
LEGIBLE.

IT IS CLASSIFIED.

IT IS PRIORITIZED.

RESOURCES
ARE ASSIGNED.

DECISIONS
ARE MADE.

IT IS PLANNED.

DECISION

INTERRUPTED
CIRCUIT

OPERATIONAL
DISTANCE

EVIDENCE MAY REACH
THE DECISION
BUT STILL **NOT REACH**
THE TERRITORY.

WHAT SHOULD
ARRIVE.

RETURN

THE TERRITORY
AWAITS.

KNOWING IS NOT ENOUGH.
TO ORIENT IS TO **CARRY THE SIGNAL ALL THE WAY TO RETURN.**

BIOIA / WUOM, 2026
