1. Abstract

BIOIA/WUOM Abstract 0.1

BIOIA/WUOM is a territory-based methodological framework designed to integrate artificial intelligence, human experience, and territorial verification in contexts of high complexity.

Its starting point is a simple observation: contemporary systems simultaneously face climatic, ecological, social, economic, technological, and institutional pressures that cannot be interpreted in isolation without losing part of their operational meaning. These pressures do not act independently; rather, they accumulate upon the same territorial foundation and continuously reshape the conditions under which decisions are made.

Unlike approaches centred exclusively on data, human experience, or automation, BIOIA proposes a methodological architecture based on the permanent interaction of three complementary components: the territory as a verifiable material foundation, situated human experience as a source of contextual understanding, and artificial intelligence as a capability for amplification, organization, and interpretative support.

The methodology is developed through an open documentary architecture integrating conceptual grammar, anatomy, technical ontology, interfaces, applications, genealogy, actor mapping, operational principles, and documented territorial case studies. This structure preserves the distinction between conceptual foundations, empirical observations, and practical applications while maintaining the coherence of the whole system.

BIOIA/WUOM is not intended to replace human decision-making. Its purpose is to provide an operational framework that facilitates the interpretation of complex situations, improves the understanding of relationships among simultaneous pressures, and reinforces continuous return to the territory as the ultimate criterion for validation.

Version 0.1 represents the first public release of this methodological architecture. It establishes the conceptual and documentary foundations for its future evolution and for the development of new orientation tools while maintaining, as its central principle, the responsible integration of artificial intelligence, human experience, and territorial verification.

BIOIA / WUOM METHODOLOGICAL CORE

DYNAMIC INTEGRATION FOR SITUATED ORIENTATION

BIOIA / WUOM • ABSTRACT 0.1 • AUGUST 2026 • CC BY-NC-SA 4.0

Figure 2. BIOIA/WUOM Methodological Core. Dynamic integration of artificial intelligence, human experience, and territorial verification as the foundational architecture of situated orientation. Orientation emerges from the continuous interaction among these three components and is validated through continuous return to the territory.

2. Methodological Core

The BIOIA/WUOM methodological architecture is founded on the continuous interaction among three complementary capacities that, when considered separately, are insufficient for interpreting complex situations. Orientation emerges only when these capacities operate together within a continuous process of verification.

Artificial intelligence provides processing capacity, organization, modelling, and analytical amplification. It enables the exploration of large volumes of information, the identification of patterns, and the support of scenario construction, but by itself it lacks the situated context required to validate its results.

Human experience contributes memory, interpretation, judgement, and contextual knowledge. It is the capacity that gives operational meaning to available information, recognizes nuances that are not explicitly present in the data, and formulates hypotheses consistent with observed reality.

Territorial verification constitutes the final criterion of validation. Every interpretation must be contrasted with the material reality where ecological, social, economic, technological, and institutional pressures act simultaneously. Territory represents not only physical space but also the verifiable foundation upon which the consequences of every decision ultimately emerge.

The continuous interaction among these three components generates a higher-order capacity referred to as **situated orientation**, understood as the ability to interpret complex relationships before intervening in them. From this perspective, orientation precedes decision, and decision precedes action.

The methodological principle that summarizes this architecture can be expressed in a simple formulation:

Without return, there is extraction.

This statement summarizes the need to maintain a permanent connection between the knowledge produced and the territorial reality that sustains it, preventing the accumulation of information or technological capacity from becoming disconnected from its verifiable material foundation.

ACCUMULATION OF PRESSURES ON THE TERRITORIAL SYSTEM

CONVERGENCE OF MULTIDIMENSIONAL PRESSURES, CUMULATIVE EFFECTS

Pressures do not act in isolation: they overlap, interact, and transform into cumulative impacts that reduce the resilience of the territorial system.

WITHOUT RETURN, THERE IS EXTRACTION.

BIOIA / WUOM • ABSTRACT 0.1 • AUGUST 2026 • CC BY-NC-SA 4.0

Figure 3. Accumulation of Pressures on the Territorial System. Convergence of environmental, human, technological, economic, institutional, and cognitive pressures upon a shared territorial foundation. The superposition of these dynamics generates cumulative effects whose interpretation requires an integrated approach and continuous verification through return to the territory.

3. Accumulation of Pressures on the Territorial System

Contemporary territorial systems are subjected to multiple pressures acting simultaneously upon the same material foundation. These pressures do not operate independently or maintain linear relationships; instead, they interact, reinforce one another, and generate cumulative effects that continuously modify the operating conditions of the territory.

BIOIA/WUOM identifies six major families of pressures that make it possible to organize this complexity without reducing it: **environmental, human, technological, economic, institutional, and cognitive pressures**. Each possesses its own dynamics, yet none can be understood in isolation because all participate in a common system of relationships.

The methodological relevance lies not only in the intensity of each individual pressure but also in their progressive accumulation upon a finite territorial base. This accumulation produces changes that exceed the sum of their individual components, altering the resilience of the system while increasing uncertainty and the difficulty of anticipating its effects.

From this perspective, orientation requires the simultaneous analysis of the relationships among these different pressures, the identification of their feedback processes, and the continuous verification of their material expression within the territory. Interpretation therefore shifts from isolated variables toward understanding the behaviour of the system as a whole.

BIOIA/WUOM proposes that the methodological response to this accumulation is not to increase processing capacity indefinitely, but rather to strengthen the integration of artificial intelligence, human experience, and territorial verification. The understanding of complex systems depends on maintaining these three capacities operating together within a continuous process of return to the territory.

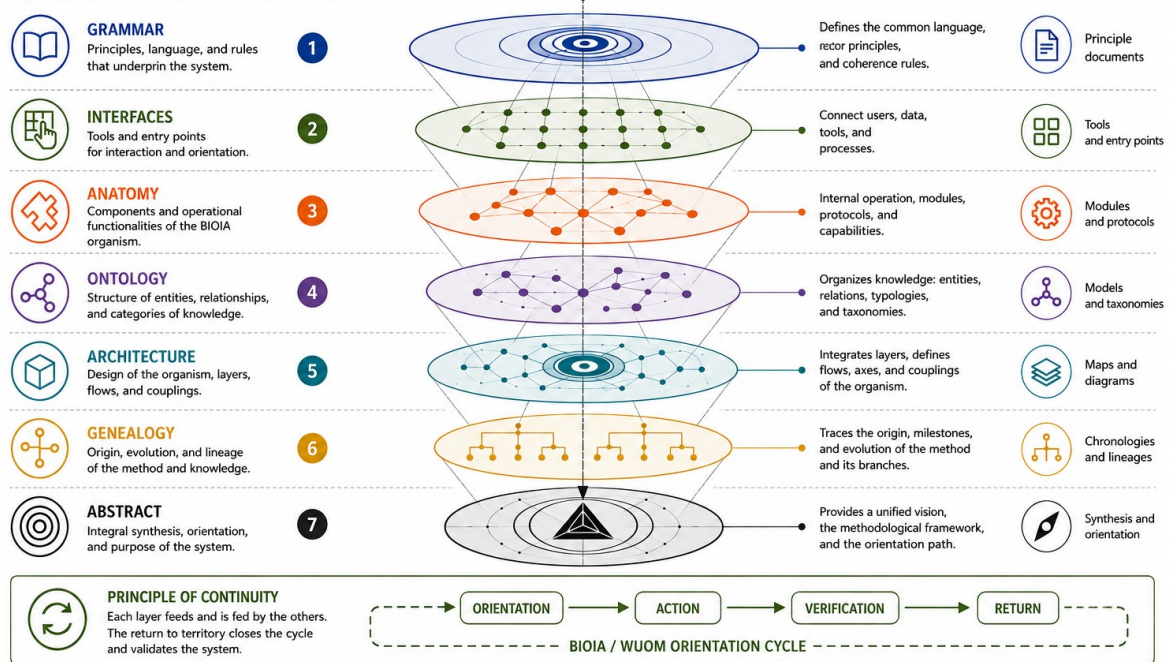

This approach makes it possible to interpret the evolution of territorial systems from a dynamic perspective, facilitating the identification of emerging patterns, the prioritization of actions, and the development of decision-making processes grounded in verifiable evidence.

BIOIA / WUOM DOCUMENTARY ARCHITECTURE

FROM GRAMMAR TO ABSTRACT: INTEGRATION, ORIENTATION, AND RETURN

KNOWLEDGE ECOSYSTEM AND OPERATIONALITY

BIOIA / WUOM • ABSTRACT 0.1 • AUGUST 2026 • CC BY-NC-SA 4.0

Figure 4. BIOIA/WUOM Documentary Architecture. Layered knowledge ecosystem that organizes the methodological structure from foundational principles to the integrated Abstract. Each documentary layer fulfills a specific function while remaining connected through a continuous cycle of orientation, action, verification, and return.

4. Documentary Architecture

BIOIA/WUOM is organized as a documentary ecosystem in which each layer fulfills a distinct methodological function while remaining interconnected with the others. Rather than representing independent documents, the architecture forms a coherent system in which every component contributes to the development, validation, and evolution of the orientation process.

The first layer establishes the **grammatical foundations** of the system. It defines the shared language, core principles, and coherence rules that support the entire methodological structure. These principles provide the conceptual framework from which all subsequent developments emerge.

The second layer consists of the **interfaces**, which provide practical entry points for interaction with the system. These include tools, gateways, and resources that facilitate access to knowledge, data, and operational processes.

The third layer describes the **operational anatomy** of BIOIA, presenting its internal components, functional modules, protocols, and capacities. This layer explains how the system operates as an integrated organism capable of supporting situated orientation.

The fourth layer defines the **ontology**, organizing entities, relationships, and conceptual categories into a coherent structure. This organization enables consistent interpretation while preserving compatibility among the different components of the ecosystem.

The fifth layer corresponds to the **architecture**, integrating the previous elements into a complete operational structure composed of interconnected layers, flows, and coupling mechanisms. Here the relationships among the different components become operational rather than merely conceptual.

The sixth layer documents the **genealogy** of the method, tracing its origins, historical evolution, and successive transformations. Understanding the development of the methodology provides the context necessary to interpret its current structure and future evolution.

The final layer is the **Abstract**, which synthesizes the complete documentary architecture into a unified conceptual framework. Rather than replacing the previous layers, the Abstract integrates them into a coherent entry point that allows readers to understand the system before exploring its individual components.

The continuity of the entire documentary architecture depends on maintaining the complete methodological cycle of **orientation, action, verification, and return**, ensuring that knowledge remains permanently connected to the territorial reality from which it originates and to which it ultimately returns.

BIOIA / WUOM GENEALOGY

EVOLUTION OF THE METHOD AND THE ORIENTATION ECOSYSTEM

Lineage, transformation, and expansion of the situated orientation method toward a territorial governance ecosystem.
WITHOUT RETURN, THERE IS EXTRACTION.

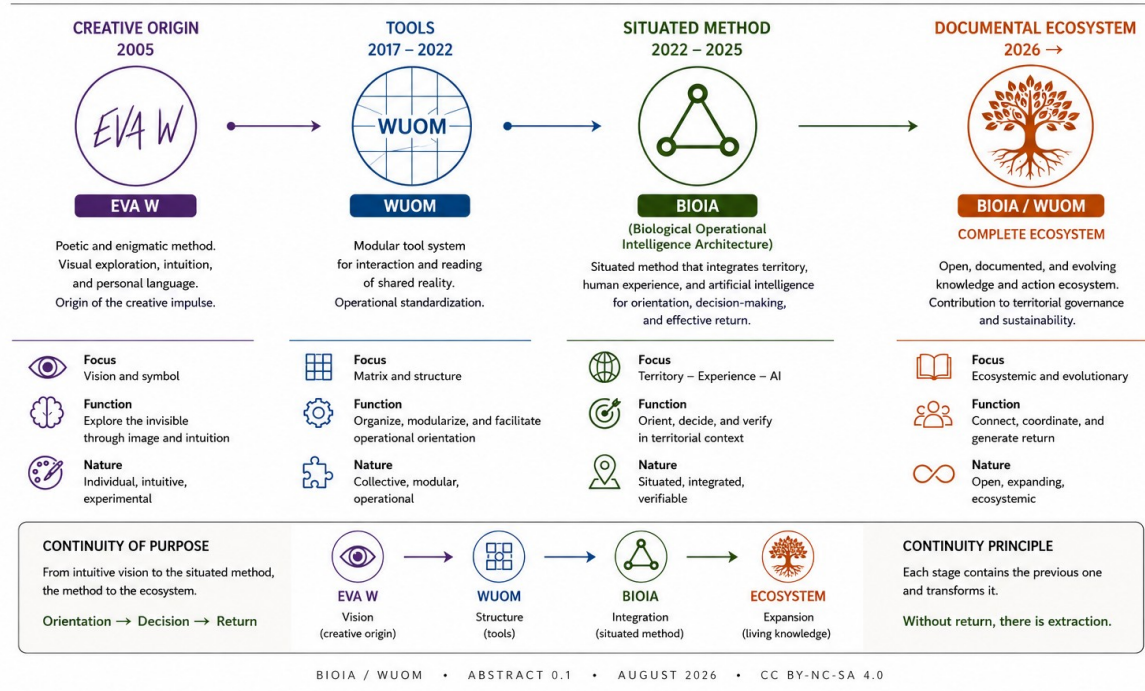

Figure 5. BIOIA/WUOM Genealogy. Evolution of the methodology from its creative origin through the development of WUOM tools and the situated BIOIA method toward an expanding documentary ecosystem. Each stage preserves the previous one while extending its operational scope.

5. Genealogy

The BIOIA/WUOM ecosystem is the result of a progressive methodological evolution in which each stage incorporates and transforms the knowledge developed in the previous one. Rather than representing isolated projects, the genealogy describes a continuous process through which new capacities emerge while preserving the coherence of the original purpose.

The creative origin begins with **EVA W**, an experimental visual language that explored observation, intuition, and symbolic representation. This initial stage established the first methodological impulse by demonstrating that visual structures could support forms of situated interpretation beyond conventional analytical models.

The second stage led to the development of **WUOM (World Union Operational Matrix)** between 2017 and 2022. During this period, the focus shifted toward operational tools capable of organizing information, structuring interpretation, and facilitating shared orientation through modular and standardized components.

Building upon this operational foundation, the methodology evolved into **BIOIA (Biological Operational Intelligence Architecture)** between 2022 and 2025. BIOIA integrated territory, human experience, and artificial intelligence into a situated orientation method designed to support interpretation, decision-making, verification, and effective return within real territorial contexts.

The current stage represents the emergence of the **BIOIA/WUOM documentary ecosystem**, where architecture, documentation, interfaces, territorial cases, and methodological developments form an integrated body of knowledge that continues to evolve through practical application and continuous validation.

This genealogy demonstrates that methodological evolution is cumulative rather than substitutive. Every stage remains present within the following one, contributing new functions without eliminating previous achievements. The continuity of the ecosystem therefore depends on preserving the relationships among creativity, operational structure, situated orientation, and documentary development.

The guiding principle of this evolutionary process remains unchanged throughout every stage:

Without return, there is extraction.

FIGURE 6

BIOIA / WUOM READING ROUTE

RECOMMENDED PATHWAY TO UNDERSTAND, ORIENT, AND ACT

A sequential path that turns knowledge into understanding and orientation into effective action.

WITHOUT RETURN, THERE IS EXTRACTION.

Figure 6. BIOIA/WUOM Reading Route. Recommended sequence for progressively understanding, applying, and validating the methodology. Each stage builds upon the previous one, transforming knowledge into situated orientation and effective return to the territory.

6. Reading Route

The BIOIA/WUOM documentation is designed as a progressive learning pathway in which each stage prepares the reader for the next. Rather than functioning as a collection of independent documents, the ecosystem provides a structured sequence that gradually transforms conceptual understanding into operational capability.

The process begins with the **Abstract**, which offers an integrated overview of the methodology, its principles, architecture, and overall purpose. This initial synthesis establishes the conceptual framework required to understand the logic of the complete system before exploring its individual components.

The second stage focuses on the **Architecture**, where the operational organization of BIOIA/WUOM is described through its layers, components, flows, and internal relationships. This level provides a structural understanding of how the different parts of the methodology interact.

The third stage introduces the **Applications**, presenting the tools, interfaces, and practical resources that support situated analysis, interpretation, and orientation. Readers begin to move from theoretical understanding toward operational use.

The fourth stage examines **Territorial Cases**, where the methodology is applied within real situations. These practical examples demonstrate how the system adapts to different contexts while validating its capacity to support situated interpretation and decision-making.

The fifth stage incorporates the **Diego Memorandum**, a continuous contextual record that documents political, climatic, territorial, and institutional developments affecting the system. This component illustrates how orientation remains permanently connected to evolving conditions rather than relying upon static information.

The final stage consists of **Updates**, where new developments, methodological refinements, and documentary expansions are progressively incorporated into the ecosystem. Continuous revision ensures that the methodology evolves through experience while maintaining internal coherence.

Together, these six stages establish a complete reading pathway that transforms understanding into orientation, orientation into informed action, and action into continuous learning through territorial verification and effective return. The reading route therefore reflects the same methodological principle that governs the BIOIA/WUOM ecosystem itself: knowledge acquires value only when it remains connected to the territory that continuously validates it.

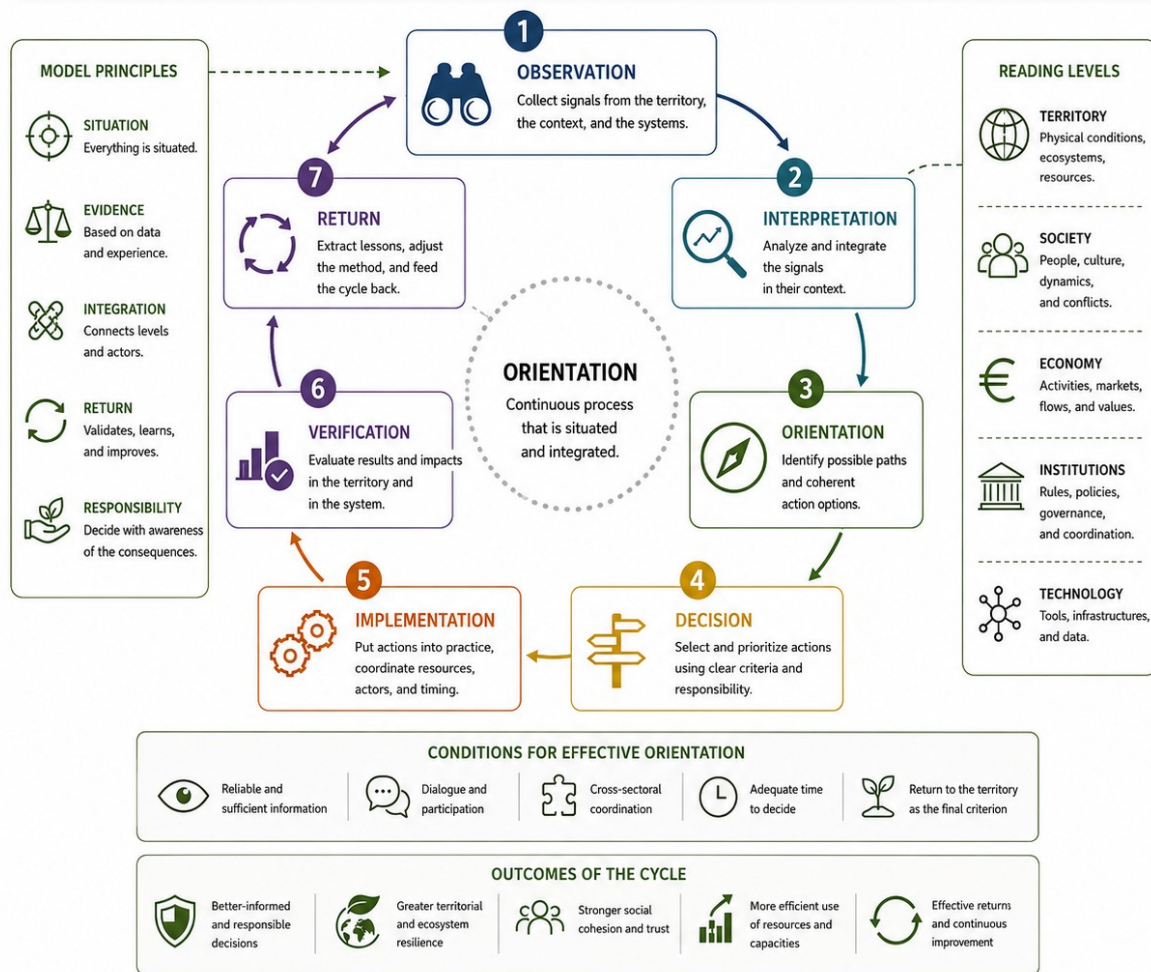

FIGURE 7

BIOIA / WUOM ORIENTATION MODEL

CONTINUOUS CYCLE TO ORIENT, DECIDE, AND RETURN

Orientation is not opinion or prediction:
it is a systematic process that turns observation
into action and effective return.

WITHOUT RETURN, THERE IS EXTRACTION.

BIOIA / WUOM • ABSTRACT 0.1 • AUGUST 2026 • CC BY-NC-SA 4.0

Figure 7. BIOIA/WUOM Orientation Model. Operational model representing the continuous cycle of observation, interpretation, orientation, decision, implementation, verification, and return. The model integrates artificial intelligence, human experience, and territorial verification as the methodological basis for situated orientation. Return to the territory constitutes the final criterion of validation.

7. Orientation Model

The orientation model constitutes the operational core of BIOIA/WUOM. Its purpose is to provide a methodological structure that facilitates the interpretation of complex situations through a continuous process integrating artificial intelligence, human experience, and territorial verification.

Unlike linear analytical models, orientation is understood as a dynamic and recursive process. Each new observation modifies the previous interpretation, and every interpretation must be verified again against territorial reality before becoming the basis for a decision. In this way, orientation remains open to the incorporation of new information and avoids the crystallization of static readings.

Artificial intelligence contributes processing, organization, and the exploration of large volumes of information. Human experience provides context, memory, interpretative capacity, and situated judgement. Finally, the territory functions as the criterion of material verification, continuously testing the coherence between the formulated hypotheses and the actual conditions of the observed system.

The model establishes that none of these capacities is sufficient on its own. Orientation emerges only when the three interact in a coordinated manner, generating a process of continuous learning based on the permanent revision of interpretations and the systematic return to the territory.

From this perspective, BIOIA/WUOM does not propose a closed sequence of actions, but rather an operational methodology adaptable to different scales and territorial contexts. Its purpose is to strengthen understanding before intervention, promoting decisions that are better founded and methodologically verifiable.

FIGURE 8 •

BIOIA / WUOM ECOSYSTEM

From the Abstract to the complete ecosystem

The Abstract 0.1 is the entry point.
This is the ecosystem that continues,
expands, and applies the situated
orientation method.
NO RETURN, THERE IS EXTRACTION.

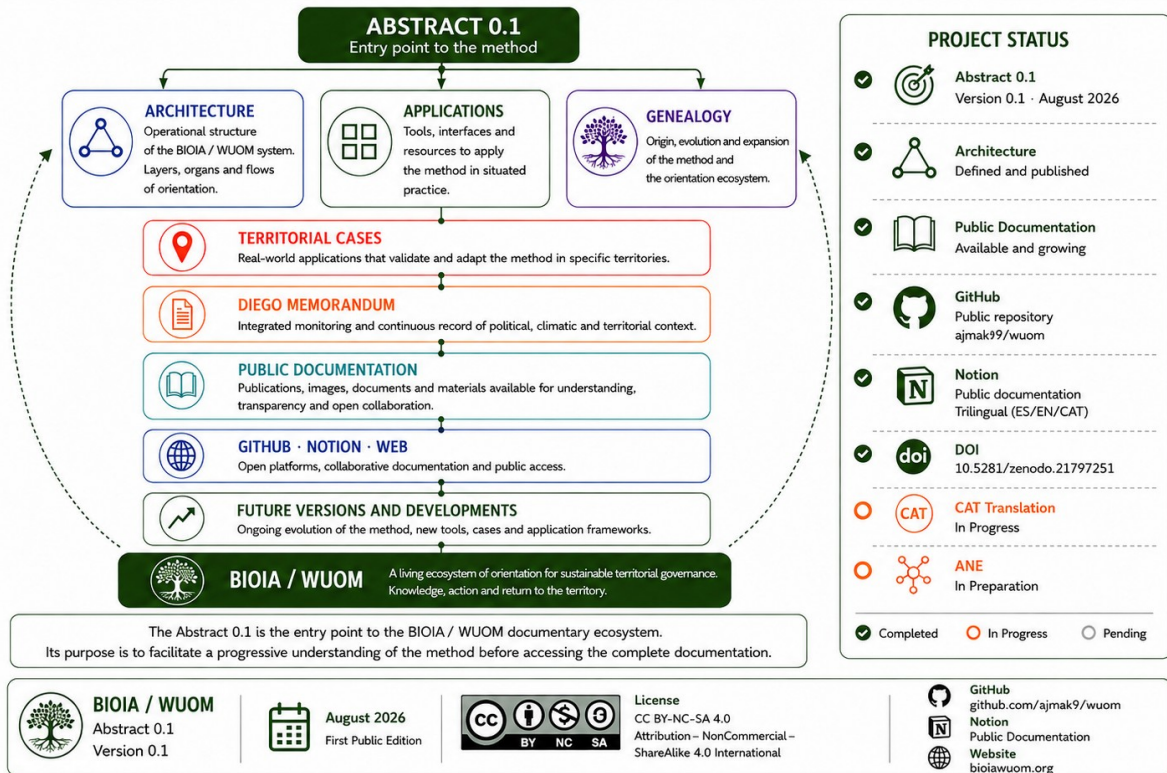

Figure 8. BIOIA/WUOM Ecosystem. Integration of the methodological, documentary, and operational components that constitute the BIOIA/WUOM system. The diagram illustrates the relationships among conceptual foundations, orientation tools, territorial applications, documentation, case-based validation, and continuous updating. It represents the ecosystem as an open, modular architecture oriented toward permanent return to the territory.

8. Ecosystem

The BIOIA/WUOM ecosystem integrates the methodological, documentary, and operational components developed throughout the project into a coherent and continuously evolving structure. Rather than functioning as isolated resources, these components operate as interconnected elements that support orientation, documentation, validation, and methodological development.

The **Abstract** serves as the public entry point to the methodology, providing an integrated overview of its principles, structure, and purpose. From this foundation, the ecosystem expands through its documentary architecture, operational applications, genealogy, and territorial cases, each contributing a specific function while remaining connected to the whole.

The **documentary architecture** organizes the conceptual and methodological foundations of the system. The **applications** translate these foundations into operational tools and interfaces that facilitate situated orientation. The **genealogy** preserves the traceability of the method's evolution, while **territorial cases** provide documented validation through real-world contexts.

The **Diego Memorandum** contributes continuous contextual monitoring, recording relevant developments that support the interpretation of changing territorial conditions. Together with the project's public documentation, it reinforces transparency, traceability, and the continuous evolution of the methodology.

Public access to the ecosystem is provided through its documentary platforms, enabling consultation of documents, images, methodological resources, and version history. This open structure allows the methodology to evolve while preserving coherence among its different components.

The BIOIA/WUOM ecosystem is therefore conceived as an open, modular, and verifiable system in which documentation, applications, territorial validation, and continuous updating remain permanently connected through the principle of return to the territory.
