

SUPERINTELLIGENCE FOR ALL TERRITORY FOR NONE

BIOIA / WUOM

SUPERINTELLIGENCE FOR ALL TERRITORY FOR NONE

BIOIA / WUOM

SUPERINTELLIGENCE FOR ALL • TERRITORY FOR NONE

The expansion of capability does not eliminate its material conditions

The proposal seems simple:

personal superintelligence for all.

An artificial intelligence capable of accompanying each individual.

Helping them create.

Learn.

Work.

Solve problems.

Develop their aspirations.

Expand their capability.

The promise places the individual at the center.

More capability for each person.

More autonomy.

More possibilities.

More intelligence available.

But one question remains outside the frame:

where does all of this materially take place?

Because an intelligence can be presented as personal.

Its infrastructure is not.

FOR ALL

Democratizing access to a powerful technology can expand human possibilities.

But democratizing access does not yet mean democratizing power, infrastructure, or decision-making capacity.

A capability concentrated in only a few institutions can also produce new inequalities.

But distributing access does not mean distributing the conditions that make that access possible.

Billions of personal intelligences do not exist only inside billions of devices.

They require:

- Infrastructure.
- Data centers.
- Networks.
- Energy.
- Water.
- Materials.
- Land.
- Manufacturing.
- Logistics.
- Maintenance.
- Technological renewal.
- And territories capable of sustaining the consequences of all of it.

The interface can be personal.

The infrastructure remains territorial.

PERSONAL DOES NOT MEAN IMMATERIAL

Artificial intelligence can accompany us through glasses.

On a phone.

On a screen.

It can listen.

See.

Interpret.

Anticipate.

Respond.

And the more invisible the infrastructure becomes to the person using the system, the easier it is to confuse accessibility with the absence of material cost.

But no digital operation eliminates the matter that sustains it.

Behind the individual experience, a chain remains:

user → device → network → infrastructure → energy → materials → territory

The cloud is not in the sky either.

It has land.

It has temperature.

It has consumption.

It has location.

EQUALITY STILL PENDING

Artificial intelligence has also been presented as a technology capable of democratizing capabilities.

Access to knowledge.

Translation.

Education.

Creation.

Programming.

Information.

Tools once reserved for specialists or large organizations can now reach many more people.

That capability exists.

But access does not yet mean equality.

Not everyone has the same connectivity.

Or the same devices.

Or the same economic capacity.

Or the same level of digital literacy.

Nor are all languages, territories, and cultures represented equally within these systems.

The infrastructure required to develop and control these technologies is not distributed equally either.

That is why AI can reduce certain barriers while, at the same time, reproducing or expanding others.

THE EQUALIZING PROMISE REMAINS INCOMPLETE

And there is one particularly significant sign:

while we speak of increasingly capable intelligences, we still need to speak about

control.

transparency.

oversight.

responsibility.

access.

bias.

concentration.

If equality had been solved by the technology itself, these questions would have lost their importance.

That has not happened.

Technical capability has advanced faster than the collective architecture intended to orient it.

That is why democratizing intelligence does not consist only of distributing tools.

It also requires distributing the capacity to understand, participate, and decide upon the conditions in which those tools exist.

And another inequality remains:

benefits can be distributed globally while burdens remain territorially concentrated.

At that point, the question of equality ceases to be only digital.

It becomes material.

THE PARADOX OF SCALE

A personal intelligence for one person may seem small.

A personal intelligence for billions of people constitutes another material scale.

That is where the paradox appears.

The architecture can maximize individual capability while multiplying collective infrastructure.

It can decentralize access while concentrating enormous material capacities to make that access possible.

It can distribute intelligence while certain burdens remain territorially localized.

That is why it is not enough to ask:

who will have access to a superior intelligence?

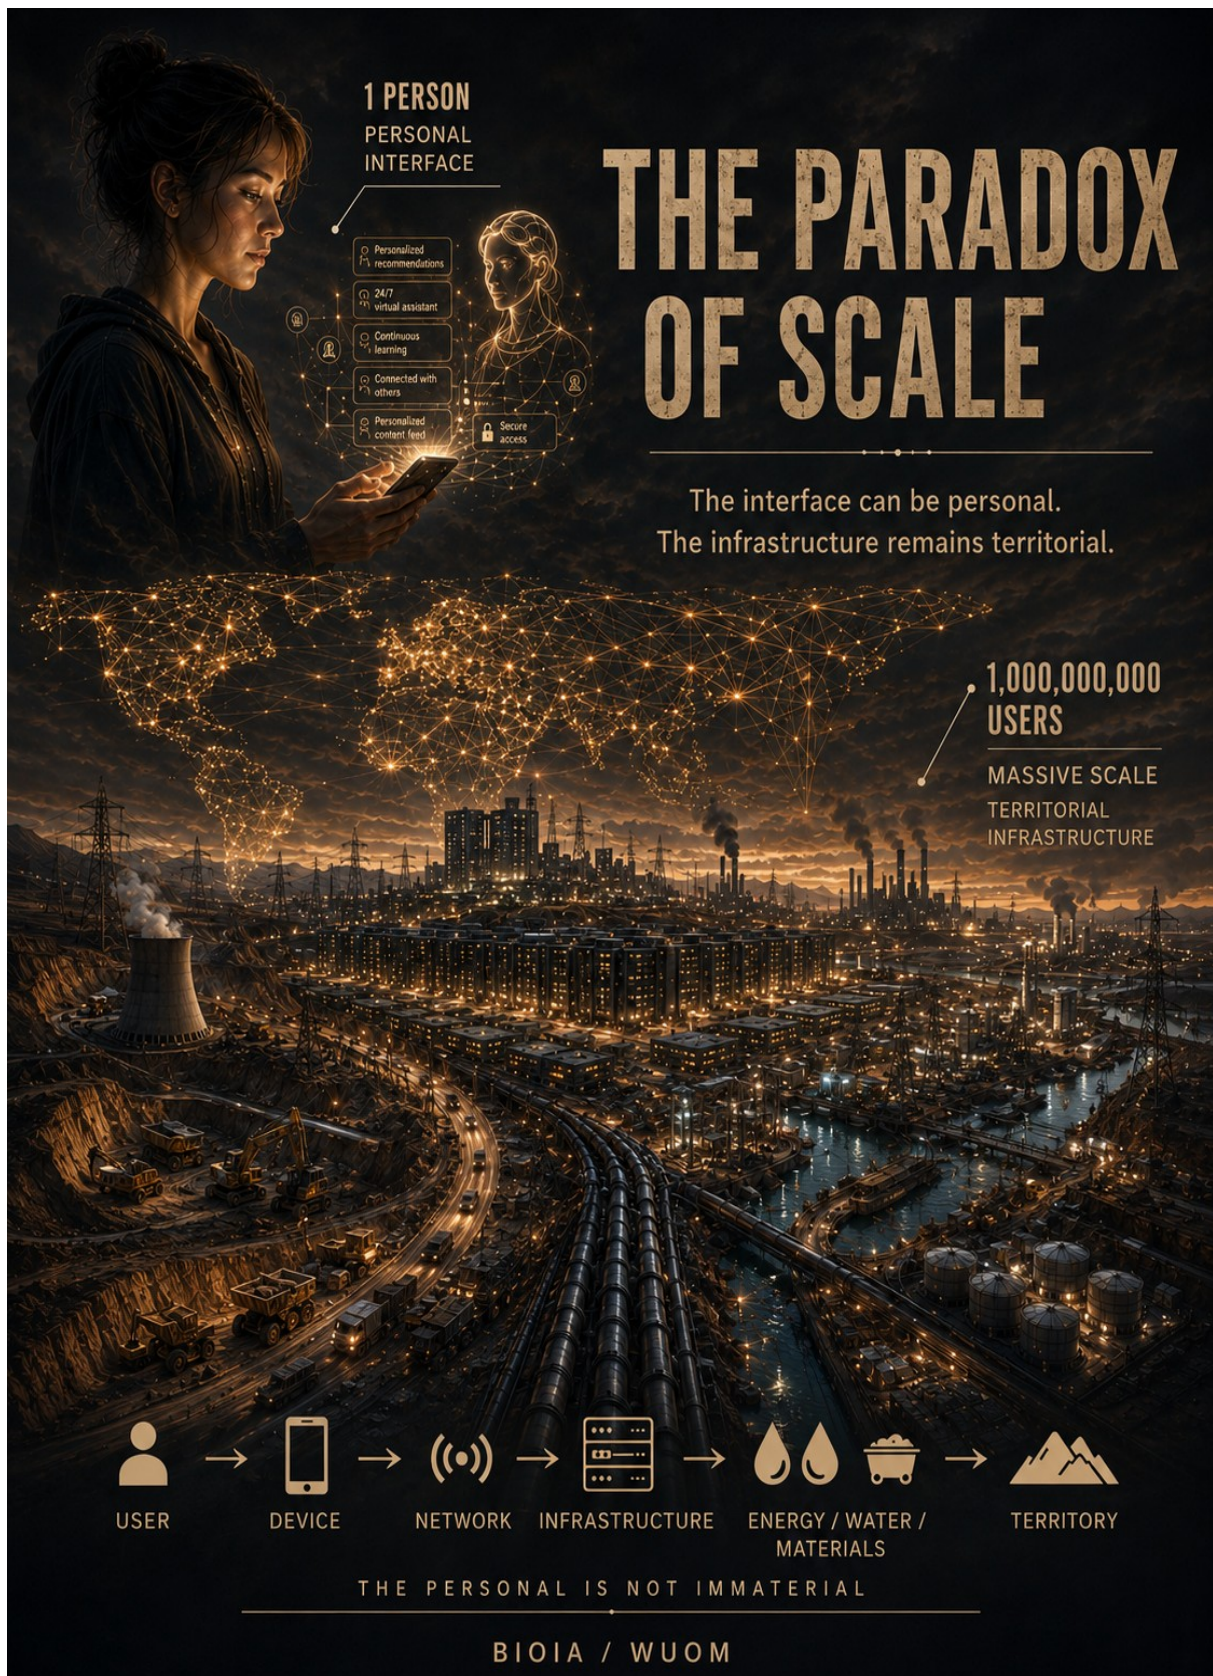

We must also ask:

which territories will sustain that access?

what resources will it use?

what pressures will it produce?

what will it return to the places that make the infrastructure possible?

THE PARADOX OF SCALE

HUMANISM WITHOUT TERRITORY

An architecture can declare itself centered on people.

That does not yet mean it is centered on life.

Technological humanism usually asks:

what can this technology do for the human?

A territorial reading adds another question:

what does it require from the material world in order to do so?

BIOIA / WUOM does not remove the human from the center in order to replace them with the machine.

It does something different:

it repositions the human within the system that sustains their capability.

Human.

AI.

Infrastructure.

Biology.

Territory.

They do not exist separately.

Because a technology can enormously increase individual power while territorially externalizing the conditions necessary to exercise it.

And then a contradiction appears:

more capability for the user

does not guarantee more return for the territory.

SUPERINTELLIGENCE FOR ALL

Imagine that the promise is fulfilled.

Each person has an extraordinarily capable intelligence.

Billions of humans use tools capable of expanding knowledge, production, creation, and decision-making.

The question would no longer be only:

what will we be able to do?

It would also be:

how much will we be able to do?

Because increasing capability means increasing the potential for intervention.

And the planet does not respond to our intentions.

It responds to accumulated material consequences.

A humanity with greater capability does not need only more intelligence.

It also needs more judgment.

More limits.

More responsibility.

More capacity for return.

Otherwise, a superior intelligence can amplify exactly what we were already capable of doing:

extract faster, produce faster, consume faster, and transform faster.

IT IS NOT A PROBLEM OF PEOPLE

It is not about one person.

Nor one company.

Nor even one particular technology.

It is about a much broader cultural and material architecture.

We know how to formulate with enormous precision:

more intelligence.

more speed.

more capability.

more access.

more productivity.

more personalization.

But we continue to formulate with far less precision:

more responsibility.

more limits.

more restitution.

more territory.

more transparency.

more democratic control.

That imbalance predates artificial intelligence.

AI can simply amplify it.

FROM CAPABILITY TO SCALE

There is a basic relationship:

capability → decision → consequence → territory

When scale increases:

more capability

→ **more possible decisions**

→ **more possible intervention**

→ **more possible consequences**

Superintelligence does not break that chain.

It intensifies it.

That is why the decisive question is not only who will have access to a superior intelligence.

The question is:

what architecture of responsibility will accompany that capability?

SUPERINTELLIGENCE FOR ALL · TERRITORY FOR NONE

An intelligence can be distributed globally.

Its consequences always land somewhere.

There may be billions of users.

But every infrastructure occupies territory.

Every system uses materials.

Every expansion requires energy.

Every operation generates pressure.

And every pressure ends up somewhere.

That is why an intelligence truly oriented toward the human cannot stop at the human.

It must recognize what makes its own existence possible.

 **human** →  **AI** →  **infrastructure** →  **territory**

And then complete the relationship:

 **territory** → **return**

Without that final movement, the architecture remains open.

It can distribute intelligence.

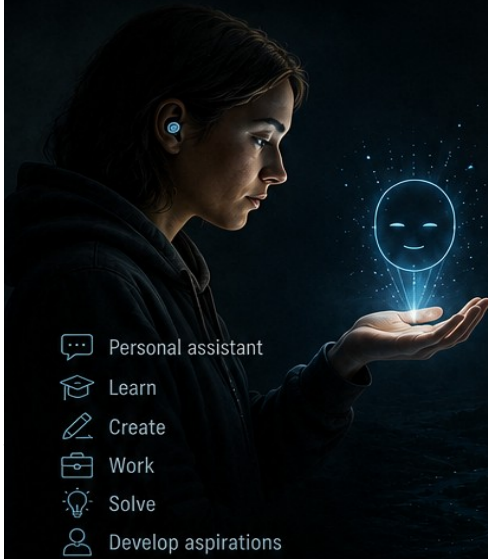

It can distribute capability.

It can distribute opportunities.

But it will continue territorializing its consequences.

SUPERINTELLIGENCE FOR ALL • TERRITORY FOR NONE

1 USER
LIGHT INTERFACE

INDIVIDUAL EXPERIENCE

1,000,000,000 USERS
MASSIVE TERRITORIAL INFRASTRUCTURE

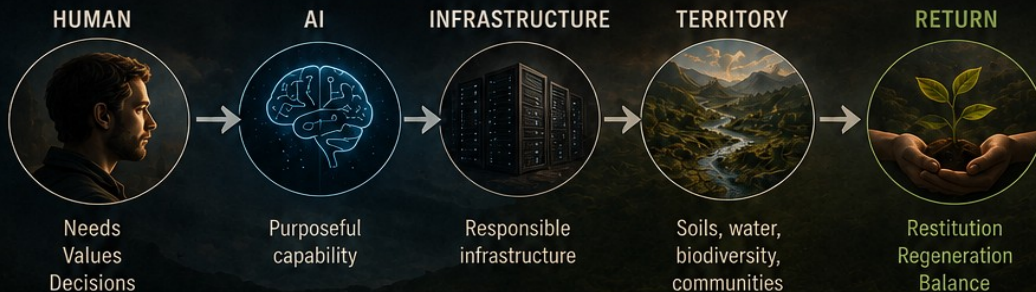

VS

COLLECTIVE LOAD • LOCAL IMPACT

THE CLOUD IS NOT IN THE SKY. IT HAS LAND, TEMPERATURE, CONSUMPTION AND LOCATION.
MORE CAPACITY FOR THE USER DOES NOT GUARANTEE MORE RETURN FOR THE TERRITORY.

INVERT THE ARCHITECTURE

WITHOUT RETURN,
THERE IS EXTRACTION.

A HUMAN-ORIENTED SUPERINTELLIGENCE RECOGNIZES WHAT MAKES ITS EXISTENCE POSSIBLE.

SUPERINTELLIGENCE FOR ALL • TERRITORY FOR NONE

SUPERINTELLIGENCE FOR ALL • TERRITORY FOR NONE

BIOIA / WUOM

A distributed intelligence without territorial return remains a distributed extraction.

Because the problem was never only how much an intelligence can do.

The problem is what happens when that capability enters the world.

SUPERINTELLIGENCE FOR ALL.

TERRITORY FOR NONE.

It can be humanistic in the interface and disoriented in the architecture.

As long as that contradiction remains open,

without return, there is extraction.

BIOIA / WUOM, 2026
