

THE TRILOGY OF ACCUMULATIVE MISGOVERNANCE

More time. More speed. More money.

+ MORE TIME

Decisions are delayed
while deterioration
continues.

+ MORE SPEED

The same direction
is accelerated to sustain
the system without
correcting the
final outcome.

+ MORE MONEY

The consequences
are financed when
the damage has
already been done.

First,
time is asked for.

Then,
speed is added.

Finally,
payment is made.

MATERIAL LIMIT

The economy can pay for reconstruction.
It cannot buy back life
or return lost territorial time.

Time is added, speed is added, money is added.
But the material base does not increase: it decreases.

THE TRILOGY OF ACCUMULATIVE MISGOVERNANCE

Speed, extremes, common time and collective responsibility

BIOIA / WUOM · August 2026

Misgovernance is not merely the absence of government. It also appears when a system retains the capacity to decide, communicate and respond, but loses sufficient connection with what materially sustains life.

In a context of accumulating crises, the difficulty no longer lies only in each phenomenon taken separately. Climate, territory, economy, politics, communication and technology can intensify at the same time and feed the same dynamic: more speed, more pressure and less collective capacity to orient ourselves.

**The more complex the problems become, the less time
we leave ourselves to understand them collectively.**

1 · EXTREMES ACCUMULATE

The extreme no longer belongs only to the thermometer. Signals of intensification appear across several planes: more extreme temperatures, territorial pressure, political polarization, economic concentration, information saturation and increasingly binary responses to increasingly complex problems.

Plane	Signal
Climate	Thermal extremes
Territory	Accumulation of pressure
Politics	Polarization and simplification
Economy	Concentration and extraction
Communication	Acceleration and saturation
Technology	Amplification of scale and speed

This is not to claim that all these phenomena have a single cause. It is to observe that they can coincide within the same system under pressure and that, when they do, they reduce the space available for slow, situated and collective responses.

2 · THE INFRASTRUCTURE OF ACCELERATION

The network allows an action to circulate instantly between different places. Artificial intelligence adds capacity for production, replication, synthesis and amplification. The combination increases the power of the system, but does not guarantee orientation or responsibility.

**Action circulates at network speed. The consequence
remains in the territory.**

This asymmetry is decisive. Opinions, decisions, campaigns, transactions and narratives can move at great speed. Territory, by contrast, receives the material consequences: heat, fire, water, soil loss, human pressure, infrastructures, waste, and ecological and social costs.

When governance is limited to reacting after impact, and communication is limited to reproducing the next signal, the system may continue to function administratively and yet produce material misgovernance.

3 • CONNECTIVITY IS NOT COLLECTIVE CAPACITY

A society can be intensely connected and still be unable to respond collectively to what it shares. Technical connectivity enables contact; by itself, it does not produce common responsibility.

Connectivity is not equivalent to collective responsibility.

Seeing a problem is not the same as taking responsibility for it. Understanding it does not guarantee action either. Between the signal and the return there is a human stretch that no platform, institution or artificial intelligence can completely replace: recognizing one's own implication, coordinating with others and assuming a verifiable share of the response.

4 • COMMON TIME AS A CONDITION

Collective problems require something that acceleration constantly reduces: enough time to look at the same situation, understand it from different positions, deliberate, orient ourselves and coordinate a response.

This is not about turning slowness into a moral value. It is about recognizing an operational limit: collective responsibility has a minimum formation time.

**SHARED PAUSE → ORIENTATION → RESPONSIBILITY →
COLLECTIVE CAPACITY → RETURN**

Without that common time, simultaneity can be mistaken for collectivity. Many people can react at once and continue acting as isolated units. A collective appears when simultaneity is transformed into shared orientation and responsibility.

5 • THE ECLIPSE: A MATERIAL PAUSE

A total eclipse offers a simple image of this difference. For a few minutes, many humans can stop and observe the same event from different territories. The phenomenon does not depend on a platform, a trend or an algorithm. The network can record it, but it cannot produce it.

That pause is not, by itself, a collective solution. After darkness, exactly the same speed may return. But it shows something elementary: the possibility still exists of sharing a time marked by a reality external to the network.

**Stopping together does not yet constitute a collective. But
it can be a condition for one to appear.**

6 • TURNING IT AROUND

The difficulty of accumulative misgovernance is that it does not admit a purely individual solution. Nor can it be resolved only with more information, more technology or more speed. When causes and consequences are collective, the response requires collective capacity.

The necessary reversal does not consist in replacing one acceleration with another. It consists in recovering a minimum sequence: territory, orientation, responsibility, decision and return.

**TERRITORY → ORIENTATION → RESPONSIBILITY → COLLECTIVE ACTION
→ RETURN**

The problem can begin to become visible through individual observation. Its solution, when it affects a common reality, requires many humans capable of assuming responsibility without losing their autonomy.

To govern is to care for what sustains.

Without return, there is extraction.
